

GenieKreator Authoring Screens: iLead Business Simulation

Oct 1, 2026 · @Manu Nair

Summary

An author reaches iLead in 4 clicks: Experience, then Simulations, then Business Simulations, then the iLead card. From there, 14 new screens and 12 area editors take them from a brief to a published simulation: a short brief, AI generation, one authoring workspace with 12 area editors, then playtest, quality check, review and publish. The screens extend the current GenieKreator patterns: dark theme, breadcrumb, pill tabs for Evaluate, Educate, Experience and Enable, illustrated choice cards with an author perspective line, and the Products list with progress, Continue Editing and Preview.

Navigation path

Level	Screen	What changes from today
1	Home, "What do you want to build?"	No change
2	Experience tab: Simulations and AI RolePlays cards	No change
3	Simulations: Business Simulations and DILO Simulations cards	New level. Today's "Create New Simulations" builder becomes Day in the Life (DILO) Simulations
4	Business Simulations catalogue: theme cards, one is iLead	New
5	iLead template page and start mode	New; the authoring journey starts here

Business vs DILO, as authors will see it

	Business Simulations	Day in the Life (DILO) Simulations
Card line	Run a team or business over several weeks, with targets, people and events	Build one day in a role, around the moments and decisions that matter

	Business Simulations	Day in the Life (DILO) Simulations
Built from	A KNOLSKAPE engine template such as iLead	A blank scenario (today's builder)
Length for learners	30 to 105 minutes, multiple weeks	10 to 30 minutes
Existing products (to confirm)	None yet	Team Engage, Fortius Altius

Journey flow

The journey has three parts: navigate to the iLead format, create a draft, then refine, check and publish from one workspace. Dashed boxes are existing builders that stay as they are.

Four clicks to iLead, then one workspace to publish

author journey · navigation to publish

Playtest opens from the workspace at any time; Products links back to the same workspace through Continue Editing.

Entry screens

E1. Experience tab (existing, no change)

Pill tab Experience selected; two illustrated cards: Simulations ("Build immersive simulations") and AI RolePlays ("Create realistic AI conversations here"). Products list below, filtered to Experience.

E2. Simulations: choose a type (new)

Element	Detail
Breadcrumb	Home > KNOLSKAPE > Products > Simulations
Pill tabs	Same 4 pills, Experience still selected, so the author knows where they are
Headline	"What kind of simulation do you want to build?"
Card 1	Business Simulations. Illustration of a team board. Line: "Run a team or business over several weeks, with targets, people and events"
Card 2	Day in the Life (DILO) Simulations. Illustration matching today's Create New Simulations art. Line: "Build one day in a role, around the moments and decisions that matter"
Help link	"Not sure? Compare Business and DILO" opens a side sheet with the comparison table
Products list	Filtered to Simulations, with a type chip on each card: Business or DILO

E3. Business Simulations catalogue (new)

Element	Detail
Headline	"Choose a simulation format"
Filters	Skill theme (leadership, sales, change, strategy, operations), learner level, session length, language
Search	By name or skill

Element	Detail
Theme card	Illustration, format name, one author perspective line, 3 chips (main skill theme, typical length, learner level), two buttons: Play demo and Use this format
iLead card	Name: iLead. Line: "Build a team leadership simulation where learners adapt their style to each person". Chips: Situational leadership, 30 to 105 min, First line to mid managers
Coming soon cards	Greyed formats with a Notify me link
Recently used	Strip above the grid with the author's last 3 Business Simulation builds

E4. iLead format page (new)

Zone	Contents
Hero	iLead illustration, name, 2 line description, Play demo, Start building
What learners do	4 icons: lead a team over weeks, set a style for each person, act through live conversations, hit a business target
What you can customise	The 12 areas as a compact grid (World, Rules, Experience and output) with 2 examples each
Skills covered	Default 8 skills with a note that the author can swap in their own framework
Sample report	Thumbnail of the participant report, opens a preview
Effort estimate	"About 45 to 90 minutes to author with AI, plus review time"

E5. Start mode (modal on Start building)

Option	Line	Goes to
Start from my brief (recommended)	"Answer 8 questions and GenieKreator drafts everything"	Brief

Option	Line	Goes to
Start from the iLead original	"Begin with Secure Capital Bank and edit what you need"	Workspace, pre filled
Duplicate one of my iLead builds	"Reuse a build you made before for a new client or cohort"	Picker, then Workspace

The modal also asks for a working title (default "Untitled iLead") and the client it is for. The build appears in Products immediately as a draft at 0%.

Brief and AI generation

B1. Brief (new)

One page, two columns. Left: 8 questions as cards the author answers in any order, by typing, picking chips, or speaking. Right: a live "What we will build" summary that fills in as answers arrive.

#	Question card	Input
1	Who are your learners?	Role title, level chips, team size slider, region, language
2	What organisation is it set in?	Real client, fictional twin or fictional; industry picker
3	What do they sell or deliver, and what is the target?	Product text, main KPI picker, target value
4	What is the business situation?	Chips: turnaround, growth, change, crisis, new launch
5	Which skills matter most?	Pick 3 to 6 from the default list or upload a framework
6	How long, and how is it run?	Full, Standard, Lite; self paced or facilitated
7	What will the results be used for?	Development or selection
8	Anything to upload?	Drop zone: org chart, process docs, values, product sheets, brand kit, policies

Element	Detail
Quality meter	"Brief strength" bar; tips to strengthen ("Add a process doc to get your real stage names")
Minimum to generate	Questions 1, 3 and 5 answered
Primary button	Generate draft
Secondary	Save brief and exit

B2. Generating your simulation (new)

Element	Detail
Progress list	The 12 areas in generation order with a tick as each completes: World first, then Rules, then Experience and output
Live peek	Cast portraits and names appear as they are generated; the scenario title and sponsor line appear first
Time estimate	"About 3 minutes. You can leave this page; we will notify you."
Notification	Bell and email when ready
Failure handling	Any area that fails shows Retry for that area only; the rest continue
On finish	Opens the workspace on the Overview, with a banner: "Draft ready. Review each area; nothing is published until you publish."

Authoring workspace

All 12 areas are edited in one workspace with three columns: the area rail, the editor and the AI copilot. Authors can move between areas in any order; nothing is locked to a wizard sequence after the draft exists.

One workspace: area rail, editor and AI copilot

Describe a change

authoring workspace wireframe · Cast area open

Zone	Contents	Behaviour
Top bar	Build name, status chip, progress %, Saved state, Preview, Quality check, Submit for review (Publish once approved)	Progress follows the formula in Products; Submit stays disabled until checks pass
Area rail	Overview, then the 12 areas in 3 groups, each with a status dot	Green: reviewed. Amber: needs attention. Grey: not opened. Padlock: locked by admin
Editor	The selected area's editor	AI badges on generated fields; Regenerate on every block
AI copilot	Suggestions, plain language edits, questions about the build	Every change shows a before and after with Apply or Dismiss; mic input supported

Area editors

Each area opens in the workspace centre. Every editor shares 3 behaviours: fields show an AI badge until the author edits them, every block has Regenerate, and locked fields show a padlock with the admin's name. Settings follow the [GenieKreator Configuration Spec](#).

Group	Area	Main editor pattern	Key components	Signature AI assist
Overview	Overview	Dashboard	Scenario card, cast strip, process strip, area status list, time estimate, quality status	"What would make this more realistic?" suggestions
World	Context	Form in 3 sections: organisation, product, scenario	Text fields, pickers, glossary table, sponsor card	Rewrite in client tone; extract from uploads
World	Branding and media	Live theme preview beside settings	Logo slots, colour pickers with contrast check, art style picker, asset library, background per screen	Generate a full image set in one art style
World	Cast	Cast studio (see its own section)	NPC grid, NPC detail, relationship map	Generate, balance and diversify the cast
World	Process and targets	Stage builder	Drag to reorder stages, add or remove, throughput per stage, target calculator, KPI dial picker	Back calculate throughput from the target

Group	Area	Main editor pattern	Key components	Signature AI assist
Rules	Leadership model	Framework picker plus band grid	Style cards, readiness band grid (Skill by Morale) coloured by needed style, delta table	Map a client framework onto the grid
Rules	Actions	Catalogue list plus action drawer	Rows with mode toggle (Static, Hybrid, Live), day cost, cooldown, limits; open a Live action to the interaction designer	Suggest which actions to make live for the chosen time budget
Rules	Events	8 week timeline board	One column per week, event cards dragged between weeks, filters by type and target, intensity curve	Generate a deck from client pressures
Rules	Time and pacing	Mode cards plus time meter	Full, Standard, Lite cards; live cap; pause rules; save and resume	Live estimate of learner minutes as settings change
Experience and output	Gamification	Toggles plus rule builder	Element toggles, weight sliders summing to 100, badge builder (event, condition, count), tier names	Theme badge names and icons to the client
Experience and output	Report	Section list plus live report preview	Section toggles and order, skills framework, linkage matrix grid with warnings, rating scale, narrative bank	Draft anchors and narratives per skill

Group	Area	Main editor pattern	Key components	Signature AI assist
Experience and output	Language and access	Settings form	Languages with translation status, accessibility checks, devices, integrations, data and consent	Translate everything, flag lines to review
Experience and output	Governance	Team and workflow	Collaborators and roles, locks, reviewers per area, version history, use declaration	Warn when selection use conflicts with settings such as a public leaderboard

Cast studio

The cast studio is where authors spend the most time, because the people make the simulation feel real. It has 3 views and one detail panel.

Views

View	What the author sees	Main actions
Board	NPCs placed in their stage columns, exactly as learners will see them, with starting stats and archetype tag	Drag between stages, add, remove, duplicate
Grid	All NPCs as large portrait cards, including sponsor, candidates and customers	Filter by role, archetype, status; bulk regenerate portraits or voices
Relationship map	Portraits as nodes, links typed as allies, rivals, mentor, friends, conflict; node size shows influence	Draw or delete links; set ripple rules on a link

A **cast health bar** sits above all views: archetype coverage, style coverage (every style needed by at least 2 people), diversity mix against the brief, and any missing hidden concerns.

NPC detail panel (opens on any card, 6 tabs)

Tab	Contents	AI assist
Look	Portrait with source switch (upload, stock, generate), attire and setting prompts, 5 mood expressions preview, avatar mode (static, animated, video)	Generate 4 portrait options in the art style; regenerate expressions from the chosen portrait
Profile	Name, pronouns, age band, role, job title, history, skills list, visible remarks, hidden concern, career goal	Rewrite remarks so the archetype cue is clear but not obvious
Stats and fit	Starting Skill, Morale, Result, Trust sliders; role fit grid per stage; sensitivity weights	"Needs" preview: which style this person needs each week if nothing changes
Persona	Personality sliders, communication style, attitude to the leader, pressure response, opening lines, knowledge scope, off limits topics, memory depth	Test chat: talk to the NPC right here to feel the persona
Voice	Voice library picker with filters (language, accent, gender, age), pitch, pace, warmth, emotional range, pronunciation dictionary, consent record for licensed voices	Play a sample line in the current mood; read any typed line aloud
Relationships	This person's links, influence score, ripple rules	Suggest links that create interesting ripples

Plain language edits work in every tab through the copilot: "Make Peter more defensive and give him a quieter voice" updates Persona and Voice together and shows a before and after for approval.

Live interaction designer

Opens when the author sets an action to Live or Hybrid and clicks Design interaction. It is a 5 step stepper on the left with a preview on the right, so the author always sees what the learner will see.

Step	What the author sets	Preview on the right
1. Setup	Format, input modes, time and turn limits, difficulty, who opens	The learner's live screen shell
2. Briefs	Learner brief (goal, context) and NPC brief (wants, fears, hides, will accept)	Brief card as the learner sees it
3. Rubric	2 to 4 skill dimensions from the linkage matrix; behavioural anchors for Strong, Adequate, Weak, Harmful; concern detection phrases; red flags	Rubric card with example lines per band
4. Consequences	Deltas per band for the target, bystanders and sponsor; triggers per band (follow up events, promises, escalation); hint policy	Outcome panel mock per band
5. Calibrate	Label 6 to 12 sample answers; run the AI evaluator on them	Agreement score, with each disagreement shown side by side

Calibration screen detail

Element	Detail
Sample set	AI writes samples across all 4 bands, in text and as audio transcripts; author can add real answers from pilots
Labelling	Author picks a band per sample with one click; optional note
Run	"Check AI scoring" runs the evaluator; result shows agreement % against the 85% gate
Disagreements	Each one shows the sample, the author's band, the AI's band and its reason; fix by editing an anchor or relabelling
Try it yourself	The author plays the interaction once in text or voice and sees the band and consequences it would trigger

Playtest, quality check, review and publish

P1. Playtest (from Preview in the top bar)

Element	Detail
Mode	Opens the real learner interface in a new tab, marked "Playtest, not scored"
Debug drawer	Hidden state per NPC (needed style, Trust, hidden concern status), last evaluator band and reason, event queue
Jump controls	Go to any week or day; trigger any event; set an NPC's stats
Notes	Pin a note to any moment; notes appear in the workspace on the related area
Exit	Back to the workspace, with notes listed

P2. Quality check

A checklist page with one row per gate: balance test, style coverage, rubric calibration (per interaction), persona test (per NPC), content safety, linkage check, accessibility. Each row shows status (Passed, Failed, Stale, Not run), the last run time, and a Fix link that opens the exact editor. "Run all checks" runs the gates in parallel, about 5 to 10 minutes; balance test results show the outcome spread for each AI player type.

P3. Review

Element	Detail
Submit for review	Picks reviewers per area (for example L&D lead for Report, brand owner for Branding)
Reviewer view	Read only workspace with comment pins on any field, plus Playtest
Decisions	Approve area, Request changes; the area status updates for the author
Gate	Publish unlocks when all areas are approved and all quality checks pass

P4. Publish

Step	Detail
Version	Version name and change note; previous versions stay available
Delivery	Link, LMS package (SCORM or xAPI), or KNOLSKAPE platform cohort
Cohort setup	Start and end dates, facilitator, leaderboard scope, language default
Confirm	Summary of mode, length, languages, use declaration; Publish button
After publish	Success screen with share link, LMS download, and Go to Products

Products list, versions and analytics

The iLead build lives in the existing Products list, with the same card layout as Team Engage today and three additions.

Card element	Today	For an iLead build
Type chip	Simulation	Business Simulation, plus a format chip: iLead
Description	Author written summary	AI drafted from the brief, editable
Progress	Under Progress, % bar	Same bar, with a defined formula (below) and a status: Draft, In review, Approved, Published
Dates	Created, Updated	Same, plus the live version name once published
Buttons	Continue Editing, Preview	Continue Editing, Preview, and Results once published
Overflow menu		Duplicate for a new client, Save as template, Version history, Archive

Progress formula: 12 areas reviewed by the author count for 70% (about 5.8% each), quality checks passed count for 20%, and review approval counts for the last 10%. An area counts as reviewed once the author opens it and confirms it, or edits any field in it.

Results (after publish)

View	Contents
Cohort overview	Starts, completions, average time, average Leadership Score, tier spread
Skills view	Average rating per skill on the 5 level scale, weakest skills across the cohort
Interaction quality	Band spread per live interaction; human audit sample status
Experience feedback	Learner ratings and comments from the end screen
Content health	Interactions where AI and human reviewers disagree, flagged for rubric tuning

Copy conventions, system states and open decisions

Copy conventions

- Headlines are questions from the author's side: "What kind of simulation do you want to build?", "Choose a simulation format".
- Card lines describe what the author will build, not what the learner will feel.
- Always "skills", never another term for skills.
- Buttons are verbs: Generate draft, Use this format, Run all checks, Publish.

System states

State	Behaviour
Autosave	Every field saves on change; top bar shows Saved or Saving
Stale checks	Any edit to stats, deltas, thresholds or rubrics marks the related checks Stale
Regenerate over edits	Regenerating a block the author edited asks first and shows a before and after
Co editing	Avatars of other authors in the top bar; a field being edited by someone else is locked with their name

State	Behaviour
Locked by admin	Padlock with the admin's name; a Request change link sends a note to the admin
Generation failure	Retry for the failed area only; the rest of the draft stays
Leaving mid flow	Draft remains in Products with its progress; Continue Editing returns to the last area

Open decisions

- ☐ Decided: Business Simulations and Day in the Life (DILo) Simulations. Confirm whether cards show DILo in full or as the acronym.
- ☐ Confirm which other formats appear in the Business Simulations catalogue at launch.
- ☐ Should Start from my brief be the only start mode in the first release, with the other two added later?
- ☐ Who may approve the Report area: any reviewer, or only an L&D lead role?
